

TASK 4

For this web application I used SQL server where the connection string was
(`"DefaultConnectionString": "Data Source=DESKTOP-LH8TJ1R\\SQLEXPRESS;Initial Catalog=Shopping_List;Integrated Security=True;Pooling=False;Trusted_Connection=True;TrustServerCertificate=True"`)

And you would only need to update the item context by using these commands if needed:

```
cd ShoppingList
```

```
dotnet ef database update --context ItemlistDbContext
```
